Our email, organized and searchable, with answers you can check

Important information about our properties lives in thousands of emails across many inboxes. This system **collects** that email, **protects** sensitive details, has AI **flag** what needs attention, and lets authorized people **ask questions** in plain English, with every answer linked back to the original email.

1 · COLLECT

Company email

New email is copied from our Microsoft 365 mailboxes on a schedule. Read-only: it can never send, change or delete email.

Mailboxes we choose can be kept out entirely.

2 · PROTECT

Screened and cleaned

Junk, newsletters and automated notices are set aside. Bank, ID and card numbers and passwords are blacked out before the AI reads it.

Possible health information is never made searchable.

3 · UNDERSTAND

Read by AI

AI in our own Azure account summarizes each email and flags action items, approvals, invoices and project risks, and the property and companies involved.

These are suggestions, never decisions.

4 · ORGANIZE

One secure library

Stored in one database in our Azure account and indexed so it can be searched by meaning, not just keywords.

Original attachments are kept for admins.

5 · ASK

Answers you can check

Ask Claude, ChatGPT or Copilot in plain English. Answers point to the emails they came from, with links to open them.

Each person signs in and sees only what they are allowed to.

Gets smarter over time. As more email is processed, the system learns our properties, companies, people and terms, and how they connect. Each fact shows how many emails support it.

Works with monday.com. An assistant can be asked to put links to an email and its files on a board item. Files are linked, never copied.

An admin console. Matthew and Cody see all collected mail, action items, project risks, costs and settings, and can correct what the AI learned.

EXAMPLES

What you can ask

- “What needs my approval this week?”
- “Which properties had schedule or cost problems this month?”
- “Who is the contractor on [property], and when did we last hear from them?”
- “Find the latest pay application from [vendor] and put the file on the monday item.”
- “Summarize everything about the [property] loan since September.”

SAFEGUARDS

How it is protected

Stays in our Azure account. Email is collected, screened and analyzed by Microsoft services in Finishes' own Azure account.

Need-to-know access. Access is granted person by person, and each person sees only what they are allowed to. The list of who can read everyone's mail is kept short and reviewed.

Every look is recorded. Each question records who asked and which emails were shown, without storing the question itself.

People decide. AI labels, action items and risks are suggestions. Nothing is approved, sent or changed automatically.

When you ask an assistant a question, the matching email excerpts are sent to that assistant (Claude, ChatGPT or Copilot) to write the answer.

STATUS

Where it stands today

WORKING NOW	Collecting, screening, AI review and search on the development system; ChatGPT connected; admin console with costs.
BEING MEASURED	How often the AI is right (labels, action items, risks, facts) still has to be checked against hand-reviewed samples.
STILL TO COME	Virus scanning of attachments, the production system, Teams messages, and direct feeds into department boards.

Testing on a development system with real company mail. Accuracy will be reported as separate measured numbers, not one score.
